This symbol stands by a very important warning concerning the safety of persons. Its non-observance can cause a very serious risk for the exposed personnel.

INTRODUCTION

The ADMIRAL photoelectric barrier is a multi-beam optoelectronic safety system. It belongs to the family of Type 4 electrosensitive devices for the protection of personnel exposed to risks arising from the use of hazardous machinery or plant.

The ADMIRAL barrier, which consists of an Emitter and a Receiver, is a type 4 optoelectronic safety device according to standards EN 61496-1 and prEN 61496-2.

The two built-in safe static PNP outputs enable the barrier to be connected to the ADMIRAL SR safety modules or to a safety PLC or to another control system that satisfies the specific requirements and safety level of the application.

A diagnostics display on the Emitter and receiver supplies the information that is necessary for the correct use of the device and to evaluate any malfunctions.

ADMIRAL is ideal for protecting:

Presses, die cutting machines, punching machines, cutting and shearing machines, robotized areas, assembly lines, palletization lines, etc.

If necessary, for any safety-related problems contact the competent safety authorities or industrial associations in the country of use.

For applications in the food industry, please contact the manufacturer to ensure that the barrier contains materials that are compatible with the chemical agents utilized.

The protective function of the optoelectronic devices is not effective in the following cases:

If the machine stopping control cannot be actuated electrically and it is not possible to stop all dangerous machine movements immediately and at any time during the operating cycle.

If the machine generates dangerous situations due to material being expelled or falling from overhead.

OPERATION

If the protected area is clear, the two outputs on the Receiver are active and enable the machine to which they are connected to operate normally.

Each time that an object bigger than or equal in size to the resolution of the system intercepts the optical path of one or more beams, the Receiver deactivates the outputs.

This condition enables hazardous machine movements to be stopped (by means of an adequate machine emergency stop circuit).

The resolution is the minimum dimensions that an object must have so that, on crossing the protected area, it will certainly intercept at least one of the optical beams generated by the barrier (Figure 1).

Figure 1

The resolution is constant irrespectively of work conditions, as it only depends on the geometric characteristics of the lenses and the distance between the centres of two adjacent lenses.

The **height of the protected area** is the height that is actually protected by the safety barrier. If the latter is placed horizontally, this value refers to the depth of the protected area.

The **working range** is the maximum operative distance that can exist between the Emitter and the Receiver.

ADMIRAL is available with the following resolutions:

- 14 mm and 20 mm (protected height from 150 mm to 1800 mm)
PROTECTION OF FINGERS
- 30 mm (protected height from 150 mm to 1800 mm)
PROTECTION OF HANDS
- 40 mm (protected height from 300 mm to 1800 mm)
PROTECTION OF HANDS
- 50 mm and 90 mm (protected height from 300 mm to 1800 mm)
PROTECTION OF ARMS AND LEGS

ADMIRAL is available also in the **Multibeam** configuration with the following lens pitch:

- 500mm (2 beams), 400mm (3 beams), 300mm (4 beams).
PROTECTION OF BODY

INSTALLATION

Before installing the ADMIRAL safety system, make sure that:

-  ***The safety system is only used as a stopping device and not as a machine control device.***
-  ***The machine control can be actuated electrically.***
-  ***All dangerous machine movements can be interrupted immediately. In particular, the machine stopping times must be known and, if necessary, measured.***
-  ***The machine does not generate dangerous situations due to materials projecting or falling from overhead; if that is not the case, additional mechanical guards must be installed.***
-  ***The minimum dimensions of the object that must be intercepted are greater than or equal to the resolution of the specific model.***

Knowledge of the shape and dimensions of the dangerous area enables the width and height of the relative access area to be calculated.

-  ***Compare these dimensions with the maximum working range and the height of the protected area in relation to the specific model.***

The general instructions set out below must be taken into consideration before placing the safety device in position.

-  ***Make sure that the temperature of the environment in which the system is to be installed is compatible with the temperature parameters contained in the technical data sheet.***
-  ***Do not install the Emitter and Receiver close to bright or high-intensity flashing light sources.***
-  ***Certain environmental conditions may affect the monitoring capacity of the photoelectric devices. In order to assure correct operation of equipment in places that may be subject to fog, rain, smoke or dust, the appropriate correction factors Cf should be applied to the maximum working range values. In these cases:***

$$Pu = Pm \times Cf$$

where Pu and Pm are, respectively, the working and maximum range in meters.

The recommended Cf factors are shown in the table below:

ENVIRONMENTAL CONDITION	CORRECTION FACTOR Cf
Fog	0.25
Steam	0.50
Dust	0.50
Dense fumes	0.25

If the device is installed in places that are subject to sudden changes in temperature, the appropriate precautions must be taken in order to prevent the formation of condensation on the lenses, which could have an adverse effect on monitoring.

POSITION

The position of the ADE Emitter and the ADR Receiver must prevent access to the danger zone from above, below and from the sides, unless at least one of the optical beams has been intercepted. Some useful information regarding the correct position of the barrier is shown in the figure below.

Figure 2

SAFETY DISTANCE CALCULATION

The barrier must be installed at a distance that is greater than or equal to the **minimum safety distance S**, so that a dangerous point can only be reached after all hazardous machine movements have stopped (Figure 3).

According to European standard EN999, the minimum safety distance **S** must be calculated using the following formula:

$$S = K (t_1 + t_2 + t_3) + C$$

where:

S	<i>minimum safety distance</i>	mm
K	<i>approach speed of object to the dangerous area</i>	mm/sec
t₁	<i>response time of the safety barrier in seconds</i>	sec
t₂	<i>response time of the safety interface in seconds (e.g. PLC or safety module*)</i>	sec
t₃	<i>machine response time, in seconds, meaning the time required for the machine to interrupt the dangerous movement following transmission of the stop signal</i>	sec
c	<i>additional distance</i>	mm

* t₂ AD SR1 = 20 msec (refer to the technical manual of each single safety module, if different from AD SR1).

The non-observance of the correct safety distance reduces or cancels the protective action of the light curtain.

If the position of the barrier does not prevent the operator from having access to the dangerous area without being detected, additional mechanical guards must be installed to complete the system.

VERTICAL POSITION OF THE BARRIER

14 mm and 20 mm resolution models.

These models are suitable for the protection of fingers.

30 mm and 40 mm resolution models.

These models are suitable for the protection of hands.

The minimum safety distance **S** is calculated according to the following formula:

$$S = 2000(t_1 + t_2 + t_3) + 8(D-14)$$

(D=resolution)

This formula is valid for distances **S** between 100 and 500 mm. If this formula results in **S** being greater than 500 mm, the distance can be reduced to a minimum of 500 mm by means of the following formula:

$$S = 1600(t_1 + t_2 + t_3) + 8(D-14)$$

If, due to the specific configuration of the machine, the dangerous area can be accessed from above, the highest beam of the barrier must be at a height **H** of at least 1800 mm from the base **G** of the machine.

Figure 4

50 mm and 90 mm resolution models.

These models are suitable for the protection of arms or legs and must not be used to protect fingers or hands.

The minimum safety distance **S** is calculated according to the following formula:

$$S = 1600(t_1 + t_2 + t_3) + 850$$

The height **H** of the highest beam from the base **G** must never be less than 900 mm, while the height of the lowest beam **P** must never be more than 300 mm.

Figure 5

Multibeam Models.

These models are suitable for the protection of the entire body and must not be used to protect arms or legs.

The minimum safety distance **S** is calculated according to the following formula:

$$S = 1600 (t_1 + t_2 + t_3) + 850$$

The recommended height **H** from the base (G) must be the following:

MODEL	BEAMS	Recommened Height H (mm)
AD 2B	2	400 – 900
AD 3B	3	300 – 700 – 1100
AD 4B	4	300 – 600 – 900 - 1200

Figure 6

HORIZONTAL POSITION OF THE BARRIER

When the object's direction of approach is parallel to the floor of the protected area, the barrier must be installed so that the distance between the outer limit of the dangerous area and the most external optical beam is greater than or equal to the minimum safety distance **S** calculated as follows:

$$S = 1600(t_1 + t_2 + t_3) + 1200 - 0.4H$$

where **H** is the height of the protected surface from the base of the machine;

$$H = 15(D-50)$$

(D=resolution)

In this case, **H must always be less than 1 meter.**

Figure 7

ELECTRICAL CONNECTIONS

WARNINGS

Before making the electrical connections, make sure that the supply voltage complies with that specified in the technical data sheet.

Emitter and Receiver units must be supplied with 24Vdc±20% power.

The external power supply must comply with the standard EN 60204-1.

The external power supply must comply with EN 60204 (it can bridge short-term mains failures of up to 20ms).

The electrical connections must be made according to the diagrams in this manual. In particular, do not connect other devices to the connectors of the Emitter and Receiver.

To guarantee reliability of operation, when using a diode jumper supply unit, its output capacity must be at least 2000µF for each absorbed A.

TEST COMMAND AND RANGE SELECTION

To select the “**Low Range**” mode, suggested for all installations below 6m, connect pin 2 to +24Vdc and pin 4 to 0Vdc. In this mode you can give the test command by bringing pin 2 to 0Vdc too. To select the “**High Range**” mode, for all installations above 6m, connect pin 2 to 0Vdc and pin 4 to +24Vdc.

In this mode you can give the test command by bringing pin 4 to 0Vdc too. Please see table 2.

Connector pins

Figure 8

EMITTER				
NUMBER	COLOR	NAME	MEANING	
1	Brown	24 VDC	Power supply (positive)	
2 (see table 2)	White	SEL RANGE/TEST1	Input 1 for range / TEST selection	
3	Blue	0 VDC	Power supply (negative)	
4 (see table 2)	Black	SEL RANGE/TEST2	Input 2 for range / TEST selection	
5	Grey	PE	 Ground connection	

Table 1

RANGE and TEST SELECTION		
PIN 2	PIN 4	MEANING
+24 Vdc	0 Vdc *	LOW range (0 ÷ 6m) (0 ÷ 2m for 14mm models)
0 Vdc *	+24 Vdc	HIGH range (1 ÷ 18m) (0 ÷ 5m for 14mm models)
0 Vdc *	0 Vdc *	EMITTER IN TEST CONDITION
+24 Vdc	+24 Vdc	Condition not allowed
* (0 Vdc or open circuit)		

Table 2

If the working distance between the Emitter and Receiver is less than 6m (2m for 14mm resolution models), is recommended to use the low range (selectable on the Emitter) (table 2).

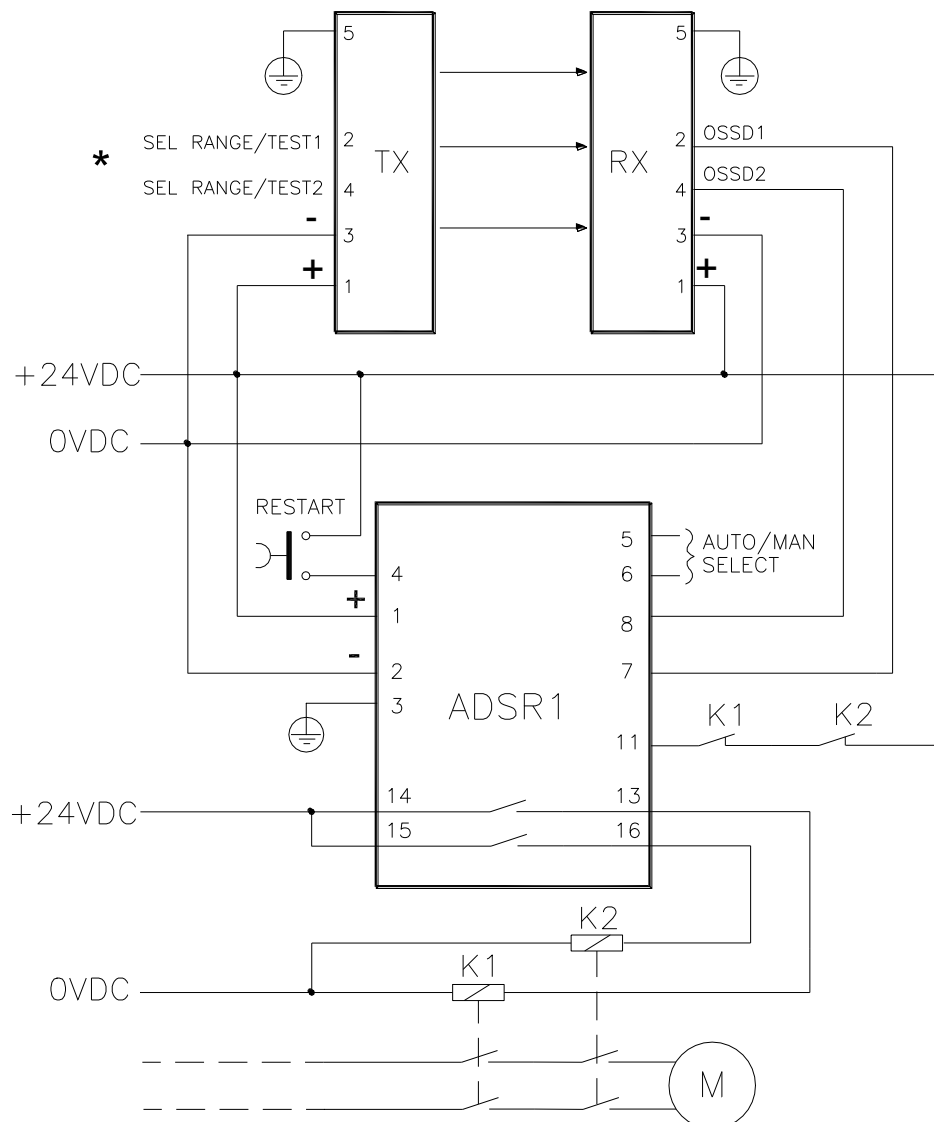

RECEIVER			
NUMBER	COLOR	NAME	MEANING

* Refer to table 2, page 10 for the correct connection of pins 2 and 4

Figure 9

Examples of connection of ADMIRAL barrier

EMITTER ADMIRAL

RECEIVER ADMIRAL

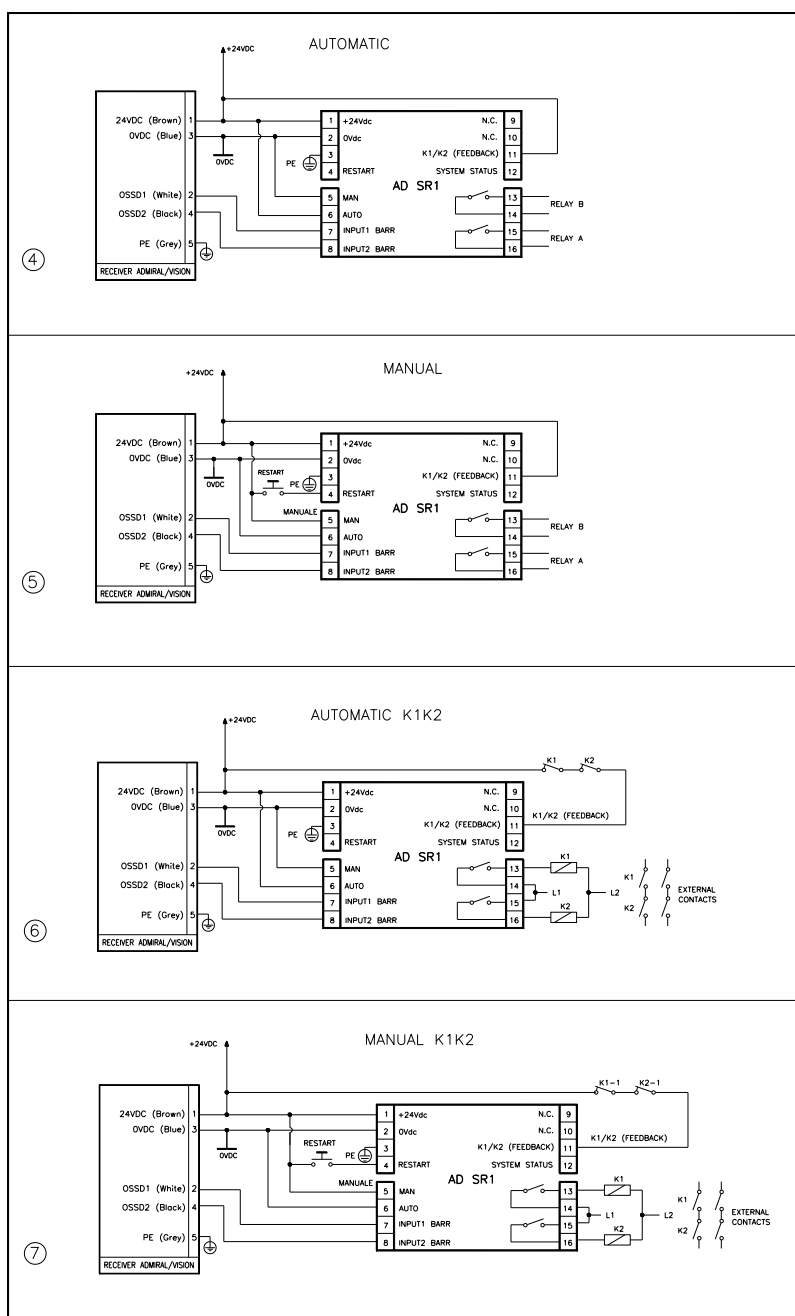

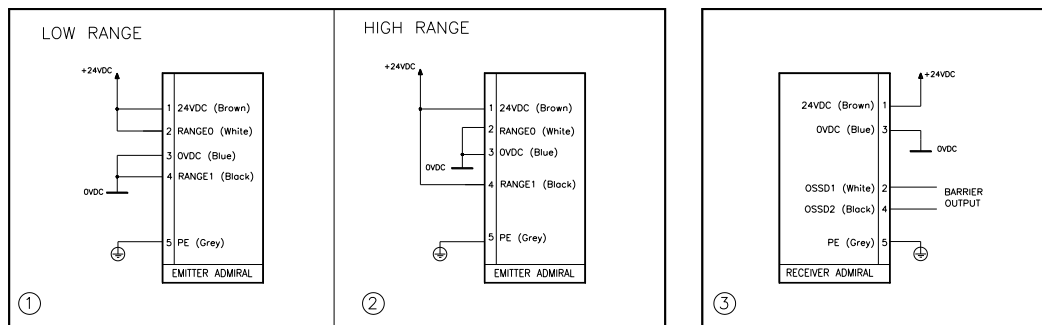

Figure 10

Warnings regarding the connection cables

- For connections over 50 m long, use cables with a cross-section area of 1 mm².
- The power supply to the barrier should be kept separate from that to other electric power equipment (electric motors, inverters, frequency converters) or other sources of disturbance.
- Connect the Emitter and the Receiver to the ground outlet.
- The connection cables must follow a different route to that of the other power cables.

MULTIPLE SYSTEMS

When more than one ADMIRAL system is used, precautions must be taken to avoid optical interference between them: install units so that the beam emitted by the Emitter of one system can only be received by the relative Receiver.

Figure 11 illustrates some examples of correct positioning when two photoelectric systems are installed. Incorrect positioning could generate interference, and may result in malfunctioning.

Figure 11

DISTANCE BETWEEN REFLECTING SURFACES

The presence of reflecting surfaces in proximity of the photoelectric barrier may generate spurious reflections that prevent monitoring. With reference to Figure 12, object **A** is not detected because surface **S** reflects the beam and closes the optical path between the Emitter and Receiver.

A minimum distance **d** must therefore be maintained between any reflecting surfaces and the protected area. The minimum distance **d** must be calculated according to the distance **l** between the Emitter and the Receiver, considering that the angle of projection and reception is 4°.

Figure 12

Figure 13 illustrates the values for the minimum distance **d** that must be maintained when the distance **l** between the Emitter and Receiver is changed.

Figure 13

After installing the system, check whether any reflecting surfaces intercept the beams, first in the centre and then in the vicinity of the Emitter and Receiver.

During these operations, the red LED on the Receiver should never, for any reason, switch off.

USE OF DEFLECTION MIRRORS

In order to protect or control areas that can be accessed from more than one side, in addition to the Emitter and Receiver, one or more deflection mirrors can be installed.

These mirrors enable the optical beams generated by the Emitter to be deviated on one or more sides.

If the beams emitted by the Emitter must be deviated by 90° , the perpendicular to the surface of the mirror must form an angle of 45° with the direction of the beams.

The following figure illustrates an application in which two deviation mirrors are used to provide a U-shaped protection.

Figure 14

The following rules should be taken into consideration when using deviation mirrors:

- Place the mirrors so as to ensure compliance with the minimum safety distance **S** (Figure 14) on each side from which the danger zone can be accessed.
- The working distance (range) is given by the sum of the lengths of all the sides that give access to the protected area. (Remember that for each mirror used the maximum working range between the Emitter and the Receiver is reduced by 15%).
- During installation, take great care to avoid twisting along the longitudinal axis of the mirror.
- Make sure, by standing near to and on the axis of the Receiver, that the **entire outline** of the Emitter is visible on the first mirror.
- The use of more than three deviation mirrors is not recommended.

MECHANICAL ASSEMBLY AND OPTIC ALIGNMENT

The Emitter and the Receiver must be assembled opposite each other (at a distance specified in the technical data sheet). Use the **fastening brackets and inserts** supplied with the system to place the Emitter and the Receiver so that these are aligned and parallel to each other and with the connectors facing the same way.

Depending on the dimensions and the shape of the support on which they are to be installed, the Emitter and Receiver must be assembled with the fastening inserts at the back, or else by fitting these in the side groove (Figure 15).

Perfect alignment of the Emitter and Receiver is essential in order to assure correct barrier operation. The indicator LEDs on the Emitter and Receiver facilitate this operation.

Figure 15

- Position the optical axis of the first and last beam of the Emitter on the same axis as that of the corresponding beams on the Receiver.
- Move the Emitter in order to find the area within which the green LED on the Receiver stays on, then position the first beam of the Emitter (the one close to the indicator LEDs) in the centre of this area.
- Using this beam as a pivot, effect small sideways movements of the opposite end to move to the protected area clear condition. The green LED on the Receiver will indicate this condition.
- Lock the Emitter and Receiver in place.

During these operations it may be useful to check the **yellow weak signal LED** on the Receiver. Upon completion of alignment, this LED must be off.

If the Emitter and the Receiver are assembled in areas that are subject to strong vibrations, the use of vibration-damping supports is recommended, in order to prevent circuit malfunctions.

OPERATION AND TECHNICAL DATA

SIGNALS

	LED	COLOUR	STATUS	DISPLAY (4)	CONDITION
Emitter	1	Yellow	On	8	System activated. Initial TEST.
	2	Red	On		
	1	Yellow	On	L / H	TEST condition
	3	Green	On

	6	Red	On		
	6	Red	On	Off	Protected area engaged
	5	Yellow	On	Off	Weak signal received
	7	Green	On	Off	Protected area clear
	6	Red	On	FAULT CODE	Malfunction *

* **N.B.:** For the meaning of the number that is displayed in case of a malfunction, please refer to the “TROUBLESHOOTING” paragraph in this manual.

Figure 16

On the emitter of the multibeam models, near each beam, is present a red led which permits an easy detection of the beam.

TEST FUNCTION

The Admiral light curtain does not dispose of a start/restart interlock circuit. In most applications this safety function is necessary. The safety relay Admiral ADSR1 permits to implement this function in a safe way according to IEC 61496-1. Please consider the risk-analysis of your application about this matter.

By means of the test function, which simulates occupation of the protected area, it is possible to verify the operation of the entire system by means of an external supervisor (e.g. PLC, control module, etc.).

The ADMIRAL barrier system features an automatic self-diagnosis function that enables it to detect response time malfunctions (this time is declared for each model).

This safety system is permanently active and does not require any interventions from the outside. The TEST function is available should the user wish to check equipment connected downstream of the barrier (without physically entering the protected area).

By means of this function the OSSDs can be switched from ON to OFF as long as the function remains active. Please see table 2 (page 10) for details about the use of the test function. **The minimum duration of the TEST function must be 80 msec.**

OUTPUTS STATUS

The ADMIRAL features two static PNP outputs on the Receiver, the status of which depends on the condition of the protected area.

The maximum load allowed is 500mA at 24VDC, which corresponds to a resistive load of 48Ω. Maximum load capacity corresponds to 2.2μF. The meaning of the status of outputs is defined in the table below. Any short circuit between outputs or between outputs and 24VDC or 0VDC power supplies is detected by the barrier.

NAME OF SIGNAL	CONDITION	MEANING
OSSD1	24VDC	Barrier clear condition
OSSD2		
OSSD1	0VDC	Barrier engaged condition or failure detected
OSSD2		

Table 4

In the protected area clear condition, the Receiver supplies a voltage of 24 VDC on both outputs. The required load must therefore be connected between the output terminals and the 0VDC (Figure 17).

CHECKOUTS AND MAINTENANCE

Verification of barrier efficiency.

Before each work shift or before switching on, check the correct operation of the photoelectric barrier.

Proceed as follows, intercepting the beams using the appropriate test object (available on request).

The correct test object must be used for testing, depending on the barrier resolution. Please see page 25 for the correct ordering code.

Refer to Figure 23:

- Introduce the test object into the protected area and move it slowly, starting from the top and moving down (or vice versa), first in the centre and then in the vicinity of both the Emitter and the Receiver.
- **Multibeam models:**
Intercept each beam with an opaque object, first in the center of the detection zone and then close to the emitter and the receiver.
- Make sure that during each stage of the test object's movements the red LED on the Receiver is always on.

Figure 23

The ADMIRAL barrier does not require any specific maintenance operations; however, periodic cleaning of the front protective surfaces of the Emitter and Receiver optics is recommended.

Wipe using a clean, damp cloth; in particularly dusty environments, after cleaning the front surface, the use of an anti-static spray is recommended.

Never use abrasive or corrosive products, solvents or alcohol, which could damage parts. Do not use woollen cloths, that could electrify the front surface.

Grooving or fine scratching of the front plastic surfaces can increase the amplitude of the emission angle of the light curtain, jeopardising detection efficiency in the presence of lateral reflecting surfaces.

It is therefore fundamental to pay particular attention during the cleaning phases of the curtain front window, especially in environments where abrasive dusts are present. (E.g. cement factories, etc).

If the yellow weak signal LED on the Receiver switches on (LED 5 in Figure 16), check that:

- the front surfaces are clean;
- the Emitter and Receiver are aligned correctly.

If the LED stays on, contact the ReeR service department.

TROUBLESHOOTING

The instructions shown on the display of the Emitter and the Receiver enable the user to identify the cause of a number of system malfunctions. As described in the “**SIGNALS**” paragraph of this manual, in case of a failure, the system is set to the stop condition and the display of each unit shows the letter F followed by a numerical code that identifies the type of failure. (See table below).

EMITTER

CODE DISPLAYED	DIAGNOSIS	REMEDY
	Anomalous connection of SEL RANGE/TEST signals	Check the connection of terminals 2 and 4 (SEL RANGE/TEST) on the connector carefully.
	Internal failure relating to the add-on boards	Return the equipment to ReeR laboratories for repair.
	Internal failure relating to the microcontroller boards	
	Internal failure	

RECEIVER

CODE DISPLAYED	DIAGNOSIS	REMEDY
	Overcurrent on one or both outputs (OSSD)	Check the connection of terminals 2 and 4 (OSSD) on the connector carefully. If necessary, reduce the load by reducing the requested current to max. 500mA (2.2 μ F).
	Detection of a hazardous interfering Emitter condition. The Receiver is able to receive the beams emitted by two different Emitters at the same time. (This fault is displayed for at least 30 seconds).	Locate the Emitter that is the cause of the disturbance and proceed as follows: <ul style="list-style-type: none"> • reduce the range of the interfering Emitter from High to Low (see table 2) • Invert the positions of the Emitter and Receiver • Move the interfering Emitter to prevent this from illuminating the Receiver • Use opaque guards to shield the beams coming from the interfering Emitter
	Connection of load between static outputs (OSSD) and the positive power supply line (+ 24 Vdc)	Check the connection of terminals 2 and 4 (OSSD) on the connector carefully. Caution: the load must be positioned between the outputs (OSSD) and 0 Vdc.
  	Internal failure relating to the microcontroller boards	Return the equipment to ReeR laboratories for repair.
	Erroneous connection of static outputs (OSSD).	Check the connection of terminals 2 and 4 (OSSD) on the connector carefully. These terminals can be connected directly to + 24 Vdc or to 0 Vdc.

	Probable short circuit between the two outputs (OSSD)	Check the connection of terminals 2 and 4 carefully.
---	---	--

In any case, when faced with a system stoppage, switch the system off and then on again, to exclude any occasional electromagnetic disturbances.

Should the problem persist after carrying out the checks described above, contact ReeR's service department. In case of continued malfunctioning:

- verify the integrity of electrical connections and check that these have been made correctly;
- check that the supply voltage levels comply with those specified in the technical data sheet;
- the barrier power supply should be kept separate from that of the other electric power equipment (electric motors, inverters, frequency converters) or other sources of disturbance.
- make sure that the Emitter and the Receiver are correctly aligned and that the front surfaces are perfectly clean.

If it is not possible to clearly identify the malfunction and to remedy it, stop the machine and contact ReeR's Assistance Service.

If correct system operation cannot be restored after carrying out the above procedures, send the equipment to ReeR's laboratories, complete with all parts, stating clearly:

- the product code number (the **P/N** field is shown on the product label)
- serial number (the **S/N** field is shown on the product label)
- date of purchase;
- period of operation;
- type of application;
- fault.

GUARANTEE

All new ADMIRAL systems are guaranteed by ReeR for a period of 12 (twelve) months under normal working conditions, against defects due to faulty materials and workmanship.

During the aforesaid period, ReeR promises to replace faulty parts free of charge. This guarantee covers both material and labour.

ReeR reserves the right to decide whether to repair equipment or replace it with equipment of the same type or having the same characteristics.

The validity of this guarantee is subject to the following conditions:

- The user must notify ReeR of the fault within twelve months following the date of delivery of the product.
- The equipment and all parts thereof must be in the condition in which they were supplied by ReeR.
- The defect or malfunction must not arise directly or indirectly from:
 - Improper use
 - Non-observance of the instructions for use;
 - Negligence, inexperience, improper maintenance;
 - Repairs, modifications and adjustments carried out by personnel not authorised by ReeR, tampering, etc.;
 - Accidents or collisions (also during transportation or due to acts of God);
 - Other reasons for which ReeR cannot be held responsible.

Repairs will be carried out at ReeR's laboratories, to which the material must be consigned or forwarded: transport costs and any damage or loss of material during transportation will be charged to the Customer.

All replaced products and parts are property of ReeR.

ReeR does not recognise any other form of guarantee or rights other than those expressly stated above; no requests for compensation for damages incurred for costs, suspension of activities or any other events or circumstances related in any way to malfunctioning of the product or any parts thereof will be taken into consideration.

In order to ensure the correct operation of the photoelectric barrier, careful and full compliance with all the rules, instructions and warnings stated in this manual is essential.

ReeR s.p.a. declines all responsibility for events arising from non-compliance with all or part of the aforesaid instructions.

Specifications subject to change without warning. • No part of this manual may be reproduced without the prior consent of ReeR.

CE DECLARATION OF CONFORMITY

Dichiarazione CE di conformità EC declaration of conformity

Torino, 15/09/2022

REER SpA

UKCA DECLARATION OF CONFORMITY

ReeR declares that ADMIRAL photoelectric safety barriers complies with following UK legislation:

- S.I. 2008 No. 1597 - The Supply of Machinery (Safety) Regulations
- S.I. 2016 No. 1101 - Electrical Equipment (Safety) Regulations
- S.I. 2016 No. 1091 - Electromagnetic Compatibility Regulations
- S.I. 2012 No. 3032 - The Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment Regulations

Please refer to the link <https://www.reersafety.com/certifications> to download the complete UKCA Declaration of Conformity.
